Dear Learning to Talk Families and Friends,

Whether or not you and your child visit the Learning to Talk Lab at the University of Minnesota or the Learning to Talk Lab at the University of Wisconsin-Madison you may have noticed that the name of the study you are participating in is called “Skills4Words.” This study is designed to help us find out more about the skills children need to learn sounds and words. We continue to find out new and exciting results as we enter the second year of the study and your children come back to us for their “Timepoint 2” visits. In this month’s newsletter we would like to highlight one of the experimental tasks that most children participate in during the recording room portion of the visit: Non-Word Repetition. Many parents ask us about this interesting task as the children play the silly word game, and earn all those stickers! We are grateful to you and your child for helping us find out more about the amazing process of learning to talk!

Best regards,
Jan Edwards, Principal Investigator

What is the Non-Word Repetition Task?

Ben Munson, PhD/Principal Investigator/University of Minnesota/Learning to Talk Lab
Nancy Wermuth, MAT,CCC-SLP/Project Manager/UW-Madison
May 21, 2014

Children come to the world not knowing how to speak a language and in a few short years they learn how to make sounds, put them together into words they have never heard before, and talk to others! It seems as if children who are school-ready start school with the large vocabularies needed for success in reading and writing because as very young children they learn sounds, and words efficiently and quickly.

Think of the job in front of every young child! Every thing and every name for that thing is new to them. They are seeing and learning about their world for the first time, just like we might have to do if we traveled to a foreign country for the first time. How do children do this important task? During their day, children come across objects they have never seen before, and someone tells them the name of these new objects. Think of your child seeing a picture of something unfamiliar in a book. Parents usually point to the picture, say the new word for the child and the child repeats the new word. The child might play around with the word by saying it a number of times and may not get all the sounds right at first. But, after repeating it a number of times and hearing it again the next day during the same story, the child might say it right! (next page...)

"...we want to find out more about how young children [learn new words] so quickly and efficiently."
At the Learning to Talk Lab we want to find out more about how young children do this so quickly and efficiently, but we needed to come up with a task that would help us create what children do out in the real world when they have to learn a new word and we needed to be able to record what they do so we could look for patterns. Our team came up with a way to create a word-learning situation in the lab called the Non-Word Repetition Task.

You may remember when your child came to the lab and sat in front of the computer and the microphone in the “sound treated” room. Your child heard a silly, made-up nonsense word like keeftane or boofkeet (what we call a “non-word”), saw a picture of an unfamiliar object at the same time, and was then asked to repeat the “silly word” (non-word) back. After the visit, we listened to the way your child said the non-word and compared it to how the computer presented it.

By listening to lots of children repeating these non-words (words which are new to them and they must say for the first time), we look for the sounds they successfully imitated and which ones they did not. We are wondering if we will see a pattern to help us understand the method children use to learn new words. The ability to learn new words is a big task that involves many steps: When children come across a new object, and hear its name for the first time, they must:

1. remember what they heard
2. hear all of the sounds accurately,
3. hold the sounds in short-term memory,
4. come up with a plan in their mind for saying the new word back, and then
5. say the new word.

This is a complicated skill! The Non-Word Repetition Task gives us a quick and efficient way to measure this word learning skill and we can do it right in the lab during the visit, because it simulates what children face out in the real world everyday when they have to learn new words.

Even more exciting for us is that our Non-Word Repetition breaks down this amazing new-word-learning task even further. The Non-Word Repetition Task is special because not only does it help us understand how children learn new words, it compares how children learn non-words that contain sequences of sounds that we don’t hear in English words very often. For example the sound sequence FT in our non-word keeftane, is often heard in English words: aFTer, fiFTy, fiFTeen, etc. When children repeat keeftane, they can use their knowledge of hearing, remembering, and saying the sequence of sounds FT from all of the times they have heard and said words in English that have the FT sequence, like the word after. But our non-word boofkeet is a different story. The children must be able to take two sounds that they already know well, the F and the K, and put them together in ways that they haven’t done very often before.

So here is where it gets exciting: we believe that the ability to repeat non-words with “strange” sound sequences, like boofkeet is a very accurate and reliable way to measure a children’s growing knowledge of speech sounds and what they do to learn new words because it’s harder to do. This is exciting because this skill has not been studied before with such young children. Your child is showing us how it’s done!
These results just in from UW doctoral researcher, Michelle Erskine!

In a recent study, Michelle Erskine at UW-Madison used the **Non-Word Repetition** (NWR) task described above, to look at one of the **Skills4Words** we feel is important to increase vocabulary size: the ability to accurately repeat new, unfamiliar “non-words.”

Michelle’s study helps us understand what young children must do to learn new, unfamiliar words they encounter in the world everyday as young language learners!

Learning to Talk seems to begin very early and depends on children accurately repeating back the new, unfamiliar words they hear in the world around them. When children have this skill, they are “school-ready” with the higher vocabularies they need for reading and writing success.

So, how did Michelle find this? She saw that in our previous studies, children from 3 to 7 years who were better at repeating sound sequences that don’t occur very often in English (such as the “pw” in “pwabug” which we don’t hear in any English words) know more words than children who have difficulty with this type of “sound” skill. The children who are good at repeating words with “odd” sound combinations seem to have the skill they need to learn and say sounds, and are the children who have higher vocabularies.

To look at how this same “sound learning” skill and vocabulary go together for children even younger than previously studied, Michelle compared how well our 2 ½ and 3-year-old children did on the NWR task and on a “standardized” vocabulary test, (a special kind of test that has been given to many children for many years and is a very accurate measure of how many words a child knows as compared to other children the same age).

Michelle saw the same result found in previous studies and was excited to confirm this finding now in younger children. Children who repeated sounds more accurately on the Non-Word Repetition task knew more words than children who weren’t as good at repeating sounds. And further, Michelle determined that children who were particularly strong at learning sound sequences that don’t occur very often in English (the “odder” nonsense words), had higher vocabularies than children who weren’t as good at this task.

The children who were good at learning these “odd,” nonsense words at a young age, were the children who knew the most “real” words. Michelle was able to say that young children who have strong “sound powers,” (better understanding of sounds in words) have more words in their “school-ready” backpacks!

Interested in helping us improve methods for teaching young children? Join our research project! Our study looks at how young children learn sounds and words! Both you and your child can be involved!

Who can participate?

- Children who are 2-5 years old
- Children who are native English speakers
- Children who have normal hearing and are typically developing or have cochlear implants!

Families are paid for their participation and your child will receive a small toy and a book. Transportation (cab) will be provided if you would like it.

How do our studies work?

Sessions take place at the University of Wisconsin-Madison's Waisman Center, 1500 Highland Ave, Madison, WI.

Your child will participate in 1-3 sessions and the sessions last about 1-2 hours.

If you would like to learn more about our studies, please email us at learningtotalk@comdis.wisc.edu, or call Nancy Wermuth at 608-263-0729, or visit our website, www.learningtotalk.org and enter your information on our Participate page. We look forward to working with you!

Please pass this information on to family and friends who might be interested in this study.

Thanks!
